OBJECTIVE

Computer Science graduate currently focused on full-stack web development. Possessing a solid foundation in front-end technologies and hands on experience in building and enhancing web application. Eager to secure a Software Developer role where I can leverage my technical and problem solving abilities to contribute to the development of scalable applications, while continuously advancing my skills as a full-stack developer in a dynamic and collaborative professional environment.

EDUCATION

Master of Advanced Computer Science, Swansea University Sep 2024-Sep 2025

Bachelor of Computer Applications, Gitam University July 2021- July 2024

SKILLS

Languages	Python, JavaScript, PHP, Java
web Technologies	HTML, CSS, React (basic)
Tools	GitHub, VS code
Other	Microsoft Excel

PROJECTS

Employee Leave Managment System (ELMS) Developed a web based Employee Leave Management System utilizing PHP to automate leave application, approval and tracking processes. Enabled efficient management of employee records by implementing robust user authentication, leave validation and seamless database integration. Enhanced workflow efficiency by minimizing manual administrative tasks and delivering real-time leave status updates.

NVisualiser 2.0 Enhanced a heathcare data visualization system using Laravel (PHP), focusing on upgrading the visualization over six dynamic chart types with Chart.js to analyze key health indicators, including glucose, BMI and cholesterol. Developed a custom "Get Insights" feature to provide advanced statistical output such as correlation, distribution patterns and odds ratio analysis, enabling real-time interpretation of complex datasets. Improved dashboard usability and performance, facilitating efficient analysis of large-scale NHANES data.

NBA Data Visualization Enhanced a data visualization system for NBA analytics as a part of academic course-work, using JavaScript and Vega-Lite within the Observable framework, focusing on the development of two interactive visualizations (a heatmap and a stacked bar chart). These visualizations analyzed key player attributes, including height, weight, position and shooting efficiency, revealing relationships and trends in the data. Implemented advanced data abstraction and transformation techniques, resulting in insights such as player distribution patterns and performance comparisons.
